

Flour & Eggs: A Baking Adventure

Wild Roots • Stage I, Lesson 3

Welcome to Mama Marcia's Kitchen

Hello, my little growers!
Come closer... can you
smell that? That's fresh
bread made from flour I
milled myself this
morning!!

Mama Marcia's Golden Rule:

When the flour is **Fresh**, the bread is
Best! The closer our food is to nature,
the stronger it makes our bodies.

The Goodness of Grains

Grains are actually **seeds**—tiny baby plants packed with over **40 different nutrients** designed to help bodies grow strong.

The B vitamins in bread help your brain think and your body move!
Every grain has its very own baking magic.

OATS

WHEAT

BARLEY

• Fibres • Vitamins • Minerals • Carbs

The GERM: The tiny living part—a baby plant that can grow into a **NEW CROP!** Packed with B Vitamins, Iron, and Magnesium.

To Germ, or not to Germ?

A	B
Freshly Milled Flour	Store-Bought Flour
◦ Keeps the Germ ◦ 3-Day Shelf Life ◦ High Nutrients	◦ Germ Removed ◦ Long Shelf Life ◦ Oils won't go rancid

The longer the shelf life,
the shorter your life.

Meet the Tiny Kitchen Helpers

Wheat has a lot of goodness inside—tiny helpers called enzymes that prepare our food for our bodies.

AMYLASE

breaks down starch into sugars. This feeds the yeast and helps the bread rise!

PROTEASE

breaks down proteins and plant fibres, making the dough softer and stretchy.

Catching Bubbles in the Gluten Net

Yeast is a tiny helper that eats sugar and creates bubbles, making the bread grow.

How does it stretch?

Gluten creates a sticky, stretchy net inside the dough. When the yeast breathes out bubbles, the gluten net catches them, making the bread fluffy!

Gluten is powerful, but some people feel sick when they eat it.

The Art of Patience

1. Mix:

Yeast + warm water + flour + pinch of salt = sticky dough.

2. Knead:

Press, fold, and turn—AGAIN & AGAIN—until smooth & stretchy.

3. Rise: Cover and let it REST in a warm spot. Give the dough time to grow.

4. Fire:

Bake until perfectly warm.

“Patience is a Virtue that makes your bread well worth the wait.”

Waking Up the Seeds: The Sprouting Pipeline

- ☒ Gives human bodies an immune & digestive boost.
- ☒ Can be eaten as a super snack.
- ☒ Fed to chickens to produce excellent eggs!

Warm water gives sleeping seeds a wake-up, and when they start to grow, we call it sprouting.

Feathered Garden Helpers

Chickens love to eat sprouted grains, seeds, bugs, and kitchen scraps. If we care for them well, they help our soil stay healthy and give us fresh eggs.

The Coop Checklist:

They need a Safe Home called a COOP, and plenty of space to walk, scratch, and explore.

Pasture-raised eggs are brighter, tastier, and have FAR more nutrients than store-bought ones!

The Compact Power Pack

"Inside this little shell, is a bundle of powerful nutrients to help our bodies grow strong."

Iron & Zinc: 
To keep your BLOOD healthy.

Protein: 
For building muscles.

Vitamins B & D: 
For brain power and EXTRA strong bones.

An EGG per DAY keeps the doctor AWAY!

Preserving the Harvest & Zero Waste

Did you know?

You can preserve fresh eggs for much longer without a fridge! Traditional methods include Water Glassing, Pickling Lime, or rubbing them in butter for a glossy finish.

Keep your EGGSHELLS!

Crush them up to give your soil a calcium boost and create bug bouncers to prevent pesky problems in the garden.

The Power of the Whole

*Together, we grow.
from shell to soil.*

So many meals start with simple magic! By slowly whisking egg yolk while adding oil drop by drop, patience turns an egg into Creamy Rainbow Mayonnaise.

Soil

Sprout

Chicken

Egg

Mayonnaise/Bread

Caring for the soil grows the grain. Waking the grain makes the sprout.
The sprout feeds the chicken. The chicken lays the egg. Together, flour and eggs nourish our bodies.

Together, we grow from shell to soil.
